**Abstract.** The present study aimed to report the occurrence of scale insects, namely *Chrysomphalus aonidum* (Linnaeus, 1758), *Ischnaspis longirostris* (Signoret, 1882), *Pinnaspis aspidistrae* (Signoret, 1869) (Hemiptera: Diaspididae), and *Nipaecoccus filicis* Williams & Granara de Willink, 1992 (Hemiptera: Pseudococcidae) on plants of *Myrciaria dubia* (Kunth) McVaugh (Myrtaceae) in the experimental fields of Embrapa Amazônia Oriental in the municipalities of Belém and Tomé-Açu, Pará State, Brazil. This is the first report of these species on *M. dubia*, as well as of *N. filicis* in Brazil.

**Keywords:** Camu-camu, Coccoidea, Myrtaceae.

*Myrciaria dubia* (Kunth) McVaugh (Myrtaceae) is native to the Amazon biome and is mainly found on riverbanks and lakeshores in Brazil, Bolivia, Colombia, Ecuador, Peru, and Venezuela (Acioli et al. 2016; Mendes & Lima Junior 2017). In Brazil, it is found in Acre, Amapá, Amazonas, Maranhão, Pará, Roraima, Rondônia, Tocantins, and in the Cerrado of Mato Grosso (Yuyama et al. 2010; Nascimento & Carvalho 2012; Mendes & Lima Junior 2017). The plant is commonly known as camu-camu in Brazil, Peru, and Colombia. It is also sometimes referred to as: araçá, araçarana, araçazinho, araçá d'água, araçá-de-ipapó, azedinha, camocamo, caçari, crista de galo, sarão, and socoró in Brazil and as guayabo and guayabito in Venezuela (Nascimento & Carvalho 2012; Acioli et al. 2016).

The camu-camu fruit is rich in vitamin C, vitamin A, glucose, fructose, starch, pectin, fiber, and minerals, such as K, Ca, Mg, Na, Zn, Fe, Cu, and Al. Moreover, it is high in antioxidants, such as polyphenols and anthocyanins, and has gained the interest of the pharmaceutical industry (Yuyama et al. 2002; 2003; Villanueva-Tiburcio et al. 2010; Freitas et al. 2019).

Under natural conditions, camu-camu trees are rarely attacked by insects. However, with the loss of ecological balance, phytophagous insects capable of causing phytosanitary problems can occur in commercial plantations in dryland areas (Couturier et al. 1999). Among these pests, scale insects (Hemiptera: Coccomorpha) stand out, as 18 species, distributed in four families, have already been previously observed on camu-camu trees (Tab. 1).

From April 2016 to July 2018, camu-camu clones that were introduced into the experimental fields of Embrapa Amazônia Oriental in Belém (01°26'S, 48°26'W) and Tomé-Açu (02°30'S, 48°23'W), Pará were evaluated for the presence of scale insects. The clones were aged five and four years, respectively. The experimental areas were formed by 10 clones, with three plants/clone and four repetitions.

In the field, camu-camu plants were inspected with a magnifying glass (20x) for better visualization of the scale insects. Leaf and stem samples were collected from infested plants, then stored in plastic bags and transported to the laboratory, where they were sorted using a stereomicroscope.

*Chrysomphalus aonidum* (Linnaeus, 1758), *Ischnaspis longirostris* (Signoret, 1882), *Pinnaspis aspidistrae* (Signoret, 1869) (Hemiptera: Diaspididae), and *Nipaecoccus filicis* Williams & Granara de Willink, 1992 (Hemiptera: Pseudococcidae) were identified (Fig. 1) from samples collected in Belém, while only *I. longirostris* was found in Tomé-Açu samples. Except for *N. filicis*, all species of scale insects identified are polyphagous, and have been recorded on several economically important plants in Brazil (Silva & Ribeiro 2000; Claps et al. 2001; Wolff et al. 2009; García Morales et al. 2016; Almeida et al. 2018; Kondo & Watson 2022a; Martins et al. 2022). The plants examined had no apparent damage.

*Chrysomphalus aonidum* grows on leaves and fruits of many plants. This species is distributed in 120 countries (Berry & Watson 2022), with records in 189 host plant genera, including eight genera of Myrtaceae (*Decaspermum*, *Eucalyptus*, *Eugenia*, *Gossia*, *Melaleuca*, *Myrtus*, *Psidium*, and *Syzygium*) (García Morales et al. 2016). In Brazil, *C. aonidum* is found in Acre, Amapá, Amazonas, Bahia, Espírito Santo, Goiás, Maranhão, Mato Grosso, Minas Gerais, Pará, Paraíba, Paraná, Pernambuco, Rio de Janeiro, Rio Grande do Norte, Rio Grande do Sul, Santa Catarina, and São Paulo (Claps et al. 2001; Almeida et al. 2018; Berry & Watson 2022; Martins et al. 2022).

*Ischnaspis longirostris* has been recorded in 99 countries (Kondo & Watson 2022b), on 161 host plant genera, including three genera of Myrtaceae (*Eucalyptus*, *Eugenia*, and *Psidium*) (García Morales et al. 2016). In Brazil, it is found in Bahia, Espírito Santo, Minas Gerais, Pará, Pernambuco, Rio de Janeiro, Rio Grande do Sul, Santa Catarina, and São Paulo (Claps et al. 2001; Kondo & Watson 2022b; Martins et al. 2022).

*Pinnaspis aspidistrae* has been recorded in 109 countries (Watson 2022) in 140 genera of host plants, including one genus of Myrtaceae (*Psidium*) (García Morales et al. 2016). In Brazil, it has been found in Amapá, Amazonas, Bahia, Distrito Federal, Espírito Santo, Goiás, Maranhão, Minas Gerais, Pará, Paraíba, Paraná, Rio de Janeiro, Rio Grande do Sul, Santa Catarina, and São Paulo (Claps et al. 2001; Almeida et al. 2018; Martins et al. 2022; Watson 2022).

[State in Brazil or city/district in Peru].

**Figure 1.** Scale insects in camu-camu trees: *Chrysomphalus aonidum* (A); *Nipaecoccus filicis* (B); *Ischnaspis longirostris* (C); *Pinnaspis aspidistrae* (D). (Photos: Aloyséia C. S. Noronha).

The only record of *N. filicis* so far was near Teziutlan, Puebla, Mexico, on ferns (Polypodiopsida) (Williams & Granara de Willink 1992; Miller 1996; García Morales et al. 2016). Among the phytophagous insect species reported by Couturier et al. (1992) on *M. dubia*, we only observed *Nipaecoccus nipae* (Maskell) in the experimental plantations in Jenaro Herrera, Requena province, and *Nipaecoccus* sp. in Jenaro Herrera and Iquitos, Peru.

*Ceroplastes jamaicensis* White, 1846, *Coccus viridis* (Green, 1889), *Parasaissetia nigra* (Nietner, 1861) and *Pseudokermes vitreus* (Cockerell, 1894) (Hemiptera: Coccoidea), and *Pseudaonidina trilobitiformis* (Green, 1896) (Hemiptera: Diaspididae) were observed on different camu-camu clones by Wolff et al. (2016). In the present study, most of these species were found in a small number of plants. However, *P. nigra* was found in 54% of the plants evaluated in Belém in the 2016/2017 biennium and was present in all clones evaluated in May and June 2018, without causing plant death. Moreover, ants were observed in all plants infected with *P. nigra*, thus hindering the collection of plant materials (Fig. 2). In plants with a higher incidence of this scale insect, the occurrence of sooty mold (*Capnodium* sp.) was also noted.

**Figure 2.** *Parasaissetia nigra* in association with ants on a camu-camu tree. Belém, Pará, Brazil. (Photo: Aloyséia C. S. Noronha).

*Parasaissetia nigra* is a polyphagous species that has been recorded on 292 genera and 101 families of plants worldwide. Among these are ornamentals and plants of agricultural importance, such as cotton, coffee, citrus, and mango (García Morales et al. 2016; Kondo & Lin 2022). With regard to the Coccoidea species found on *M. dubia* in the Loreto region of Peru, *P. nigra* was the only harmful species for causing intense proliferation of sooty mold (Couturier et al. 1992).

The present study represents the first record of the scale insect species *C. aonidum*, *I. longirostris*, *P. aspidistra*, and *N. filicis* on *M. dubia*, as well as the first report of *N. filicis* in Brazil.

## Funding Information

Embrapa Brasileira de Pesquisa Agropecuária - Project 02.14.01.023.00.00.

## Authors' Contributions

WMON and FLG were responsible for setting up and maintaining the experimental areas. ACSN and RHSS conducted field and laboratory activities. VRSW, VCPS, and MBK identified the species of the scale insects. ACSN and VRSW wrote the manuscript. All authors discussed and revised the manuscript.

## Conflict of Interest Statement

The authors declare that there is no conflict of interest.
